Project overview[#](#)

The Bazaar manages a directory of software either running on the QNX platform or enabling the creation of such software. The directory lets members of the community share source and/or binaries without the overhead of supporting an independent project.

The directory includes commercial, non-commercial, demonstration as well as open-source software. Contributions can be as complex as a complete solution or as simple as a library.

We will gladly promote contributions residing outside of Foundry27. We also make available a source repository as well as a project downloads area for contributors who prefer avoiding the overhead of managing an external repository and/or a website.

Finally, the project hosts the development of ports to the QNX RTOS.

What's in it for developers?[#](#)

- Provide extensive listing of software that runs on the QNX RTOS.
  - Access the [directory](#).
- Share software that either runs on the QNX platform or helps develop software for the QNX platform.
  - To post to the Bazaar, contact the [QNX Community Management Group](#).

Downloads[#](#)

The [directory](#) lists software available for the QNX platform and links to their download site.

License(s)[#](#)

Each software contribution listed within the directory is presented with its particular license.
