

## Photon FAQ#

- Q: Can I write Photon and GF/GLES code in the same application?
- A: Yes you can!! In QNX SDP 64x, Photon and GF are almost "one and the same". With the GF code, you just have to ensure you follow the proper `gf_draw_begin()/gf_draw_end()` paradigm, otherwise Photon's io-graphics will become deadlocked (io-graphics is actually a Photon to GF "translation" server now). Examples using GF and GLES within a Photon window are posted in the Project Downloads section.
- Q: What happened to the Photon capability of rotating the display orientation that was previously present in QNX Momentics 63x?
- A: Because of the move of Photon to GF in Athens 6.4, we've lost this feature/functionality (because GF doesn't provide the infrastructure for rotation); re-adding support for this functionality will be decided in a future release.
