Get It -- Downloading the Core Networking 6.4 Source[#](#)

This is the easy way to get the Networking source down to your system and start working with it. For a deeper understanding of how the repository is structured, you will want to read about the Networking source tree.

Direct Source Repository Access[#](#)

The networking source is maintained in a single Subversion (SVN) repository and can be checked out:

svn checkout --username <userid>@qnx.com http://community.qnx.com/svn/repos/core_networking/trunk

Where **<userid>** is the username you created to register with the QNX Developer Community (myQNX). Anonymous access is not currently provided to the source repository.

An [SVN](#), or subversion, command-line client is included as part of the Momentics Development Environment for Neutrino hosts only. For windows and linux hosts you can download it from from http://subversion.tigris.org/.

This will get you the Networking source which includes the stack, drivers and protocols (QNET and IP) as well as the associated libraries, services and utilities for networking.
